WATERCRAFT DNA Powder Dip – Highly Effective Attractant for Hook Baits

Product information

The **DNA Powder Dip** was specially developed to coat hookbaits precisely. It contains the same highly effective DNA stimulators as our boilies, wafters, pop-ups, and dips. The attractants dissolve immediately in the water and lead the fish straight to your rig.

Repeated dipping in combination with a Watercraft Liquid/Dip creates a thick, active layer around the bait that takes effect immediately in the water. An enticing scent trail forms from water-soluble DNA extracts, which develops maximum attractiveness within the first few minutes.

The **DNA Powder Dip** can be used with pop-ups, wobblers, particles, and boilies. The contents of the tin are sufficient for numerous applications. Be sure to always close the tin tightly after use, as the high-quality water-soluble ingredients attract moisture and may clump.

Application:

- Dip your hookbait in the liquid, or simply moisten it in water
- Then roll the bait in the Powder Dip.
- Repeat the process up to two times until an active DNA attractant layer has formed.
- Ideally, let the bait air dry for a minute or longer before using it at your fishing spot.

Features:

- Designed for wetting and coating hook baits
- Contains the same DNA attractants as boilies, wafters, and pop-ups
- Creates an active attractant signal in the water
- Suitable for pop-ups, wafters, particles, and boilies
- Repeat dipping for an active attractant layer
- Can with freshness seal, contents: 150ml / 50g

Note: This highly effective attractant won’t bring fish from the other end of the lake—where there are no fish, none can be caught.

BUT:

- It triggers maximum feeding response in cautious fish
- An absolute game-changer in competitions
- Tests showed a significantly higher catch rate
- Fish take the bait faster – more catches
- Formula tested for over a year under competition conditions
